Brunswick Community College is proud to announce the purchase of the Amatrol Environmental Application System and Thermal Troubleshooting System for the Heating/Air Conditioning program.

The state of the art troubleshooting training equipment consists of a mobile workstation, vapor-compression type thermal system, thermal multi-meter, gauge/manifold assembly, computer-based fault insertion system, student learning material for both theory and lab, and teacher's assessment guide. Students will learn industry-relevant skills including how to operate, adjust, and troubleshoot thermal systems for a variety of applications.

The Environmental Applications Learning System adds to the Thermal Troubleshooting Learning System to teach heating and cooling applications. Students will learn industry-relevant skills including how to size, select, and analyze thermal systems to optimize performance. The Environmental Applications is a working system that connects to the Thermal Troubleshooting Learning System to provide a functional thermal application of air conditioning and heat pumps. Ronald Skoog, HVAC Instructor at Brunswick Community College says "This new training equipment will surely advance our current program."
